Dial files can be used for many different things. Files compression, encryption, separated archives, and more are only a few clicks away once you understand the different things that postal archives are capable of. Photo by Claire Bell. What are zip files? Think about how the Windows folder works. You drop the content into the file-organizing folder, and then you can transport that folder to any location on your computer, and the files inside it go along with it. The files work in the same way, except that the content inside the folder (file zip) is compressed to reduce storage usage. What if you have a folder that contains 20 files and need to send it to someone by email? Well, you can't send a folder email to someone, so you'll have to email 20 separate files. That's where the email files become really useful because you can zip up those 20 files in one email archive and then send it via email. Along with the convenience of having all these files in one zip archive, they will also be compressed to reduce storage and make transferring them over the Internet, which is much easier. This is where the definition of a mail file ends for most people. What you may not understand is that you can do much more than just compress and combine files with postal archives. As a zip and unzip files, before we get back to more complex topics, let's go back to our example and show how we'd zip up those 20 files that we need to email and then show how the host user will unpack them. Windows has the ability to zip up and unpack files without any additional software, so don't download any programs just to create basic archives or unpack them. To create a zip file, click the right button in an empty area on your desktop or explorer, go to a new one and select a compressed Folder. You'll notice that the process is similar to creating a new folder, as you can now rename the zip folder and move it to different places on your computer. With the zip file you've created, just select and drag the files into the zip folder. As you can see in the screenshot, the files are copied into the zip folder, rather than moved or removed from their original location. Now you can transfer, back up, or do whatever you want with lightning content. Another way to quickly zip up some files is to highlight them, the right button and click Send a zgt; compressed (zipped) folder. The easiest way to unpack a file is to right click on it and click Extract All. A new window will open and you can choose where you want the files to be retrieved. By default, it will extract content to the same directory as your mail file. Just hit the extract and the folder will be created that has all the zip files Advanced Windows features can easily zip and unpack files, but you'll need a third-party app to do something more. There are a bunch of programs out there that offer extra features for zip files, but one of the easiest, multi-coman and efficient is

7-sip, 7-Sip is a free file file for Windows, which comes with all the options you should ever need for email files. Click on this link to be taken to your website and download the latest version of the program. The setup is simple, just take the license agreement and click on until the 7-zip is installed. After that, you should be able to highlight the files, right click on them, and add them to the zip archive with 7-zip. When you press the Add button to the archive, you'll be presented with several options. Let's take a look at what each one means and why they might come in handy. Encrypting files this would be helpful when you don't want someone without proper authentication to see the files in your email archive. Don't forget to use a strong password, so brute force and dictionary attacks become useless. CypScripto vs. AES-256 - If you decide to create an email file (as opposed to 7z), you'll get a choice between qipCrypto encryption and AES-256. Cipesto is weak, but has fewer compatibility issues. The AES-256 is much stronger, but only works with new systems (or with those that have 7-zip installed). Try to select AES-256 whenever possible. File Name Encryption - Sometimes file names can be as important as the content inside the file. In other cases, maybe not. If you need to encrypt file names, so it's impossible for someone to see which files are in your archive, you'll need to use a 7z file extension instead of zip. This can be a problem because you need a 7-zip to open 7z files, and what if the receiving user doesn't have a 7-zip? This problem can be solved by creating a self-healing archive that gives you the best of both worlds. If for some reason you need to use the .zip extension and you need file encryption, you just have to settle for unencrypted code names. If you use the 7z archive format, you'll see a Encrypt file name: Self-Extracting Archives (SFX) Self-ing Archive is nothing more than a regular mail file, but with an extension of the .exe file. The execution of the file will automatically start the extraction process. Benefits - There are two big advantages to self-extraction of archives. First, you can use the .7z file extension function to encrypt file names. Secondly, the host user does not need special software to open the archive. Double-click .exe, click the statement and you're done untangle the files. Disadvantages - People won't be too eager to open up the execution of an email attachment. If you use 7-zip to archive some files and send them to someone you don't know very well, they may be tired of opening a file, and their antivirus may even issue a warning. Aside from this small caveat, self-healing archives are great. Dividing archives into volumes saying you have a 1GB file and want to put it on two A CD can hold 700MB of data, so you'll need two drives. But how do you split your file so it can fit on those two drives? With 7-sip, that's how. You can choose from the common values listed above, above, Enter your own custom size, which you want to divide the volumes into. Note that you can't create a self-aggrvied archive if you choose to share your archive like this. Encryption, however, is still possible. Also note that Windows is not able to open split archives, so you'll need a 7-sip or other capable program to open them. To open a divided archive, all parts must be in one place. Then, just open the first file, the 7-sip (or any app you use) will seamlessly combine them and then extract the files for you. Better compression is another reason why you can use a 7-zip instead of a built-in utility for better compression speed. Going above normal can make the process take significantly longer, especially for a large group of files and slower processors. You also won't save a significant amount of space, so it's usually just best to keep the compression level up to normal. However, sometimes these few extra megabytes are a big deal, so keep this option in mind for times like the ones. The qIP file is a compressed file and is the most widely used archive format you'll be working on. The qIP file, like other file formats, is simply a collection of one or more files and/or folders, but is compressed into a single file for easy transportation and compression. Most commonly used for email files is to download software. Tipping software saves storage space on a server, reduces the time it takes to upload it to a computer, and keeps hundreds or thousands of files beautifully organized in a single file. Another example can be seen when you upload or share dozens of photos. Instead of sending each image an email or saving each image one at a time from the website, the sender can put the files in the archive so that only one file has to be transferred. The easiest way to open a qIP file is to double-click on it and let your computer show you the folders and files inside. In most operating systems, including Windows and macOS, email files are processed internally, without the need for any additional software. However, there are many compression/decompression tools that can be used to open (and create!) postcode files. There's a reason they usually call postal/unzip tools! Including Windows, almost all programs that unzip files also have the ability to zip them up; in other words, they can compress one or more files in the format of the I.D.P. Some of them can also encrypt and protect them with a password. If we had to recommend one or two, it would be Pea'ip or 7-zip, both excellent and completely free programs that support the format. If you don't want to use the program to open the qIP file, many online services support the format, too. Online services such as Files2Zip.com, B1 Online Archiver and ezy-sip, allow you to simply download the file to see all the files inside and then download one or more of them separately. I recommend using online zip-up only if the SIP file is on the small side. Downloading a large file and managing it online will probably take you more time and energy than just downloading and installing a standalone tool like a 7-sip. You can also open the qIP file on most mobile devices. iOS users can install i-ip for free, and Android users should be able to work with files using the qIP file via B1 Archiver or 7th cipper. SIPX files are advanced files created and opened with version 12.1 or newer, as well as Pea-ip and some other similar archival software. If you need help opening. Zip closure. CPG file, see what is a CPG file?. Files can only be converted into something similar. For example, you can't convert an image file, like JPG, into an MP4 video file, more than you can convert a postcode file to a PDF or MP3. If this is confusing, remember that email files are just containers that contain compressed versions of the actual file (s) that will be available to you. So if there are files inside the file that you want to convert, like for a PDF in DOCX or MP3 at AC3- you must first extract the files using one of the methods described in the section above and then convert those extracted files with a file converter. Since the zip is an archive format, you can easily convert the zip code into RAR, 7, ISO, TG, TAR or any other compressed file, in two ways, depending on size: If the qIP file is small, we strongly recommend using Convert.Files or Online-Convert.com free online converter. These works just like the online postcode openers already described, which means you will need to upload the entire zip code to the website before it can be converted. You can use qIP2ISO to convert postcodes to ISO or I-zarc to convert postcodes into many different archive formats. If none of these methods work, try one of these free file converters for sometimes used formats to convert the qIP file into another file format. The one that I particularly like is the zamzar, who can convert the SIP into 7, TAR, B-2, Y-1 and other archive formats. If you've protected your password but forgot your password, you can use a password cracker to delete it to restore access to the files. One of the free programs that uses brute force to delete a mail password is the Cracker Pro mail password. Some postcode files may have a file name with a different file extension until the zip is finally expanded. Just keep in mind, as with any type of file, it is always a very recent extension that determines that file. For example, Photos.jpg.zip is still qIP, because JPG comes in front of the postcode. In this example, the archive is probably named this way, so it's quick and easy to determine what the images are of JPG inside the archive. Some backup software will back up the qIP files so that they are compressed to save space, are put together to facilitate the search, and are kept in a general format, so that backup can be opened even without the original backup software. One such programme that it's a backup of COMODO. To make a file in Windows, click on the files and/or folders that should be archived, and then select Send to the folder zgt; compressed (zipped). To zip files/folders into macOS, click on them on the right and select the compression elements from the menu to make the Archive.zip file. The qIP file can be up to 22 bytes and about 4GB in size. This 4GB limit applies to both the compressed and uncompressed size of any file inside the archive, as well as the total size of the qIP file. The company's creator, Phil Katz' PKWARE Inc., has introduced a new zip format called SIP64, which raises the size limit to 16 EiB (about 18 million TB).
